For example, it can construct a complete building by stringing together geometric shapes representing the walls, floor, and ceiling. The software's easy-to-use interface makes it an extremely versatile tool. CAD software is a 3-D design tool, and therefore it's possible to "view" the model from many different angles. For example, it's possible to see the structure by looking at it from above, below, and from the side. The process of designing and constructing a building is often referred to as a project. A project can last anywhere from several minutes to several months, depending on the complexity of the design. AutoCAD is a very powerful tool and can perform a wide range of complex tasks.
