* Photoshop is a powerful tool for photographers and many designers, but professional editing is beyond what it was originally designed for. On the upside, though, any pro can use it. **What's New in Photoshop CS6?** Photoshop has undergone major changes in the last few versions of the software. The three most significant were: • The program is built as a native 64-bit application. The previous 32-bit application ran only one version of the program at a time. • The Tools panel was redesigned, and it is arranged by task. Toolbars are for different uses, similar to Windows, and you no longer use menu commands to switch tools as you might have done in earlier versions of Photoshop. • The operating system that Photoshop runs on is also 64-bit. This allowed Photoshop to be expanded so it would run in 64-bit processors or multiple CPU cores, thus allowing for faster performance. A huge feature is the new Content-Aware Scaling, which detects and enhances the edges of an image. You can get a large-format photo made to fit inside a small one, for instance. This makes it useful for cropping, but also for resizing digital negatives. See chapter 4, Resizing, for more. **Photoshop Elements 13:** For those who don't want to buy a complete package of Photoshop, have been unable to afford it, or just prefer an easier program, Photoshop Elements offers the same powerful image-editing features at a fraction of the cost. ## **Photoshop**

Q: mongodb - restrict which servers can read/write I'm new to mongodb but I have read a lot about how to protect your data to stop concurrent writes of invalid/duplicate data etc. I'm using a mongodb for Windows server 2008, installed in a network. Is there a way to set the mongodb service (running as a service) to allow only specific servers to access it? The above question is about whether there is a way to restrict who can access the DB but I would also like to know whether you can stop someone sending requests to the server. A: MongoDB does not currently support access control. I would be surprised if it ever does because it's really not a hard problem to solve. But you're probably not going to do that in the first place anyway, because storing all of your data is probably a much bigger security risk than trusting someone to read or write from another server. Just don't allow that server to write to your db and don't allow any other unrelated servers to read from it. That should be enough to keep your data safe. For your users, there are multiple ways to limit the access to the MongoDB service. For example, if you're running a Windows service, I believe that you can create service accounts for each user that you want to allow access and configure that specific service account to connect to the MongoDB service. Or if you're not running a Windows service, you could run the MongoDB service as a system account and limit access through the group policies in the target machines. One other point of note, the MongoDB service is not locked down to prevent someone from using it to access other services. So if you have a MongoDB service running on port 27017, but no other services, anyone can connect to that port and then start and use a server with whatever port they like. So you're probably better off just making sure that no one can connect to the right port on the server if you want to really secure it. Q: libusb_open returns libusb_error (-1) I'm trying to use libusb but I'm stuck. I'm following the libusb tutorial. I'm getting the libusb_error (-1) and I'm not sure what that means. What's New in the Adobe Photoshop 2021 (Version 22.4.3)?

I know many of you are sick of hearing about the Seattle Seahawks' 3-1 start, especially after seeing much of the same-old-same-old all season long. Well, their lackluster performance in a win over the Oakland Raiders on Sunday doesn't mean we shouldn't still continue to honor the Seahawks for everything they have done this year. One of the things that I think is most impressive about the Seahawks are the small things they do that really go unnoticed. There are so many small things that go into a game that really make the difference for the Seahawks. 1) Offense This is one of the most underrated units for the Seahawks. They scored over 30 points in every game this year except for Sunday. They also only allowed one touchdown in the Raiders game. One of my favorite small things from Seattle is how well Russell Wilson manages games by constantly looking downfield for wide receivers. I believe that this is the biggest reason why the Seahawks offensive unit has been so productive. They have been successful all year because their offensive unit has done a great job of not turning the ball over. Even though they are starting a rookie quarterback, they are doing an excellent job of commanding the offense. They also throw the ball quickly with a quick release. That allows the receivers to go get their yardage after they catch the ball. This team has five Pro Bowl receivers and two Pro Bowl running backs. The running backs, Marshawn Lynch and Thomas Rawls, are the two running backs that are the reason the Seahawks can run the ball so well. I would describe Lynch as an old man that still runs for yardage in the open field. He is not the greatest runner, but he is the best pass blocker and receiver out of the backfield. Lynch also has a great sense for the open field. Rawls is a guy who can be dangerous as a pass receiver out of the backfield. He has so many strengths and weaknesses. He is a smart and quick running back that has the same speed as Lynch. He also has a great sense of catching the ball out of the backfield. He can also be dangerous as a receiver out of the backfield because of his quick cuts to the outside and can be a physical runner in the open field. But, one thing that Rawls doesn't do is make the most of his opportunities. If he gets in the open field, he runs straight up the middle. That was shown against the Raiders. In
