AutoCAD 1.0 included a set of features for the AutoCAD operator's interaction with a computer. The first feature was a command line, where the operator could enter text commands directly into the application. The text was placed in a scratch area on the screen, where the operator could revise the text by typing it into the scratch area. The operator could then activate or run the command by pressing a key on the keyboard. The operator's actions on the screen were always recorded into the drawing data. The second feature was a pencil, where a previously stored file of commands could be reused by making new commands, and storing them in the drawing file. This was commonly referred to as "block" in the industry, although it is not a block feature in AutoCAD, but a feature that works more like an assembly of commands. The third feature was a "draw mode", where the operator could draw a representation of a component (a car body, for example) on the screen. Later, the drawing could be exploded into several components, giving the operator the ability to see, edit, and rotate any part of the drawing. The fourth feature was also a draw mode, but the operator drew on the screen instead of creating a component. This allowed the operator to draw various paths and lines that would be used to create new blocks or shapes. Later, commands were added to allow the operator to automatically place and label blocks, and even create

The .NET and Java APIs are based on the legacy ObjectARX API and thus support most of the listed file formats. History AutoCAD first released in 1989 for DOS. AutoCAD was written by the AutoDesk company, and was heavily inspired by the Apple II graphics and drawing programs such as HyperCard. Supported file formats Only the newer formats of the standard, accepted by CAD organizations are supported. To create a new drawing, the file format must be selected.
