overweight women. Epidemiological data suggests that Mediterranean populations have lower rates of cardiovascular disease than populations in other countries. However, the dietary components contributing to this protective effect are incompletely known. The aim of this work was to evaluate the effect of the consumption of a Mediterranean diet supplemented with extra virgin olive oil on plasma lipoproteins and lipid profile. Sixty-six overweight or pre-obese women (body mass index, 25-35 kg m⁻²) were randomly assigned to two groups: one group supplemented with extra virgin olive oil (n=33) and the other with refined sunflower oil (n=33), both for 8 weeks. Lipid and lipoprotein
