\* Adobe Photoshop Elements ([www.adobe.com/products/photoshop\\_elements.html](http://www.adobe.com/products/photoshop_elements.html)) is a commercial version of Photoshop, with fewer features and a simplified interface. Most of the Elements features (like its layered technology) are transferred to Elements from Photoshop. \* GIMP ([www.gimp.org](http://www.gimp.org)) is a cross-platform alternative to Photoshop. It is also a free download, but lacks the professional features and capabilities of Photoshop. \* Paint.NET ([www.getpaint.net](http://www.getpaint.net)) is another free, easy-to-use, cross-platform alternative. You can add filters and patterns to images as well. 1. \*\*Start up Photoshop Elements, open a photo, and create a new document.\*\* 2. \*\*Click the New Layer icon from the Layers panel to bring up the New Layer dialog box.\*\* 3. \*\*In the Name box, type\*\* Iris \*\*for the layer name.\*\* 4. \*\*Click OK.\*\* You've now created a new layer, which you can use to edit the Iris subject. 5. \*\*Edit the layer as needed, perhaps cropping the image to a more manageable size.\*\* You can always edit the image on the Background layer, but this layer is perfect for graphic elements like this one, which don't require the type of transparency a Background layer would require. As you work, remember to lock your layers so that changes you make to an image won't apply to the underlying layer. Locking a layer is easy by clicking on the layer in the Layers panel to reveal a lock icon in the bottom-right corner of the Layer panel. When you're finished, click the lock icon again to unlock the layer. 6. \*\*In the Layers panel, click the eye icon to see your layers.\*\* Layers and how you work with them on a given image is the primary way that you can control how an image looks. The majority of the techniques you learn in the next few chapters work by first placing a layer over an image and then working with it. When you use layer management tools, such as the Move Tool, you have several choices: \* You can move the layer in the Layers panel. \* You can add new layers. \* You can duplicate a layer. \* You can merge

Adobe Photoshop was originally released in 1990 as a tool for professional photographers and graphic artists. It's most well-known feature is the "smart object", a selectable in-painting tool which finds and corrects flawed regions in the image. appeared at the time. 1. Cropping Cropping is one of the most important features of any image editor. You can use Photoshop for this functionality, but it offers a very clunky way to perform this. Photoshop Elements offers a much simpler cropping tool which is much quicker.
2. Artistic and photo effects For this reason, Photoshop Elements may actually be a better option for many photographers. The toolset provided by the program is much more advanced than what you'd expect to be found in any photo editing program. If you're looking for an advanced editing program to edit your

Sepsis Blog In the last couple of days, the most alarming new pandemic threat, coronavirus, came close to eradicating anything previously believed to be a given: that people will get together to celebrate holidays and other events. But somehow, we've managed to stay home from work, home from school, and home from our routines. Now, we see pictures of couples celebrating Valentine's Day in parks and picnics, and in fact, we see them all around us, not just on TV. Some of these people are getting more than just a flower or a candy bar. One-year-olds are struggling with this choice, and getting more confused by the hour. How do they make the best decision? In some of the news reports and comments I've seen, people have praised adults for "playing it safe." Well, for a start, saying that is a bit of a hoot. No one really has the right to criticize parents who are responding to a situation where the risk of an infection is high. I won't even get into the "do your job" remark, or the surprise at all the unwed mothers who are supposed to be the cause of this epidemic. Frankly, my first reaction is that whoever's filling those houses needs to be on antibiotics. What's alarming, in my view, is that this threat, not only of an epidemic, but of a pandemic, has to do with an adult. We've all heard about kids being brought home from school by concerned parents who have just found out that their child is very sick, and that this was not just a minor illness. That's a real-world problem. What's not a real world problem are the parents who refuse to believe that there's a problem. That's never the case in real life. But they insist on holding the child, to make sure they're okay, and not to take the risk of letting them run around to contaminate everyone. It's also the case that some parents, when they've confirmed the diagnosis, go on to suggest that the child tell others that they're fine, and to not reveal the real situation. In other words, they keep the child's condition secret. That'

About Me Thursday, October 24, 2006 The \_\_\_\_\_ are out of the garden and eating my strawberries We had a scare when we were at Nonna's house earlier this week. We found out that the berry bushes are laden with baby black bears. We were concerned that they might come down and eat our strawberries. If they actually touch our fruit, well, it could be a problem. However, the bears seem to have gotten the hint and have left our berries alone. They are wary of us because we have taken down many of the feeders that used to attract the bears. In their defense, they remind me of the comedian Sully Stevens, whose one-liner is, "If bears aren't out of the garden, they're in the garden." Which is exactly what we're seeing here. Although there are no babies or bears in the garden, some opportunistic squirrels have moved in and are eating our ripe strawberries. How dare you? No? Just me? Garden of weevils is a somewhat ironic title. After all, the bugs that are eating our fruits and vegetables are actually beneficial insects that eat the pests. My most recent offering of this title was the June 16, 2006 issue of The Pacific Northwest Senior News. In her article, Jean Ehrlich writes, "It is thanks to the white grubs (larvae) that most of our fruits, nuts and vegetables are safe from the notorious pests called weevils." At this time of the year, black bears are living off the fat reserves they built up while eating berries during the summer. They generally aren't out and about, so have no need for feeders. And they certainly don't have their own area of the garden. However, it's hard to imagine that all the berry bushes are completely free of pests. I saw a sign posted on the front of one of the bushes that said, "Bears don't eat strawberries." At the time, I thought it was funny and not entirely accurate. You have to be more vigilant about protecting your berries, just in case there are baby bears in the garden. And, oh, by the way, "worms are good for your garden." Thanks to the hardy critters that keep me from having to eat my own homegrown fruits and vegetables, they can be found
