* But the basics in Photoshop do require some learning, as there are a number of menus, toolbars, and commands that must be mastered before basic image manipulation can begin. Photoshop has layers that allow you to position objects on a flat, two-dimensional surface. In a layered file, you can make changes to individual layers or all layers at once, using either image editing or design features in Photoshop. In this chapter, I show you how to get started with Photoshop, enabling you to tackle your first projects in the program. Managing Layers You can work with layers in Photoshop by using the Layers palette, a set of thumbnail representations of the different layers that you create. You can add, rename, and move around layers as much as you want, even when you're manipulating multiple images on a page or in a document. To work with layers, you need to create a new document in Photoshop. Chapter 3, "Photoshop Elements Toolbox," and Chapter 14, "Designing a Web Page," introduce you to the program's interfaces and lists the many different ways you can open Photoshop's workspace. For this book, I'm assuming you have Photoshop set up as an application window; choose Window=Workspace to see it. If you're using Photoshop Elements, you may find working with layers more intuitively; see the next section for more on this. In the Layers palette (Figure 4-1), you see thumbnail versions of the layers that exist in the file you're working on. 1. Click a thumbnail in the Layers palette to open that layer in an editing window. You're now editing the layer as a whole, in its entirety. You can also use Layer Commands to edit individual layers. 2. If a layer is selected in the Layers palette, you can use the Layer menu and a drop-down arrow to toggle the visibility of the layer in the Document window. If a layer isn't selected, the Layer menu is grayed out. You can use the Layer menu to create and delete layers, as well as select all the layers in a document or a specific layer. This menu also enables you to change the blending mode, opacity, and other settings for layers. **Figure 4-1:** The Layers palette provides thumbnail views of the various layers that exist in your file. Keep in mind that layers aren't something you create in a file; instead, you can

From the government's own documents obtained via a FOIA request... While searching for gay pornography on his government computer, a Department of Defense official in 2008 used the search engine Google and typed in a term that was deemed particularly offensive by an unknown person on the Internet, according to government documents. A government official searching for gay pornography on a government computer in 2008 used the Internet search engine Google and typed in the term, "teen fisting," according to government documents. An unnamed Department of Defense employee was doing a routine search on his government computer for gay pornography when he typed in "teen fisting," a term that could be offensive to some, which is why it was highlighted to administrators. "A memo (written by administrators) indicated that the term 'teen fisting' should have been searched for on the CD drive before searching for porn," according to an email from a gay activist to the Human Rights Campaign, a gay rights organization. "The CD drive search could potentially affect the lives of LGBT servicemembers." The incident was only brought to light after the gay activist appealed to the Department of Defense for information about this incident. An April 10, 2013, email to the human rights group OutServe-SLDN described the incident and pointed out that the same Google search engine included gay websites with gay porn in the results. What's New In Adobe Photoshop CC 2015 Version 16?

Q: Parsing through csv with Ruby So I have a CSV that I'm importing into a database, but I'm stuck on the parsing part. Sample CSV "1,Stackoverflow";"Forum";"Community" "2,Serverfault";"Forum";"Forum" "3,superuser";"Forum";"Forum" I'm trying to filter the amount of threads to the forum and display the amount of the forum. The forum is defined as any string that's not the prefix of "Forum". My code so far String csv_string = File.read(CSV_FILE).to_s csv_string.split(",") csv_string.split(';').compact csv_string.split(";",").reject{ |line| line == "1"}.join CSV is into an array, sorted by the forum. ruby-1.9.2-p136 :005 > String.split(",").compact => ["1", "2", "3"] ruby-1.9.2-p136 :006 > String.split(";",").reject{ |line| line == "1"}.join => "1,Stackoverflow" So I would be left with "1", "Stackoverflow";"Forum";"Community" A: CSV is not always neatly sorted. You can sort it, then use array.join and array.map to group them by forum: def group_by_forum(csv,forum) csv = csv.sort csv.group_by do |line| line[1].split(';')[-1] == forum end end Mysticism is the hardest part of the puzzle for me, the "other side" of rationalism. Having said that, there is no definition of what "moves" something from one state to another. It's like asking someone what love is. It's a feeling. You can have a feeling of love for someone, or you can have it for a pile of rocks, or a tree. No logical rational thing can convince me that the love I feel for my cats is "real" love. What is the difference? I hate to
