This is very important in web design as you need to be able to position each of the layers as you go along. It's easy to do in Photoshop too. Accelerators are hardware-specific instruction sets that can seek to optimize the application to the specific hardware on which the application will run. They can be app specific, or they can be device specific. They can provide an option to the host software to coordinate computing resources with the accelerator to the same end goal: to render output to a display screen. For example, a consumer 3D accelerator on the new Radeon GPUs offers a special instruction set that can render panoramic images and projections/cones of 3D spaces by using its shader assets faster than even the host graphics card can render the same or similar geometry. A GPU-attached DIGITS™ keyboard let's you author media in Adobe Premiere Pro. In Solid Edge, you can create, fix, and scale model geometry and materials by using a built-in GPU. With OpenGL and OpenGL ES, the application software can request the GPU to render a rendering target. Sometimes this request can be made on a repeated basis to support animation or other frame-by-frame tasks. Without a dedicated GPU, the system must render the page or screen update as a CPU-based operation. The GPU is used to render 3D objects. When Photoshop is run on a system with a GPU, the GPU is engaged almost immediately and used through the majority of the job.
